

SADISH PANTA

BACKEND DEVELOPER | NODE.JS | EXPRESS.JS | REST API DEVELOPMENT

Nepal | GitHub: github.com/BSadish | LinkedIn: [linkedin.com/in/sadish-panta-686547237](https://www.linkedin.com/in/sadish-panta-686547237)

PROFESSIONAL SUMMARY

Backend-focused BCA student in the 7th semester with hands-on experience building RESTful APIs, authentication systems, database-driven applications, and real-time communication features. Developed projects using Node.js, Express.js, JavaScript, MongoDB, Mongoose, JWT, bcrypt, Redis, Socket.IO, Docker, Cloudinary, Multer, Git, Linux, and Postman. Experienced with API design, authentication and authorization, CRUD operations, database relationships, pagination, search and filtering, caching, rate limiting, file uploads, and event-driven communication. Seeking a backend developer, Node.js developer, or software engineering internship.

TECHNICAL SKILLS

Languages: JavaScript (ES6+), TypeScript (learning), HTML5, CSS3

Backend: Node.js, Express.js, REST APIs, HTTP, Middleware, Authentication, Authorization, JWT, bcrypt, CORS, Error Handling

Databases: MongoDB, Mongoose, MongoDB Atlas, Schema Design, Data Modeling, CRUD, Population, Pagination, Sorting, Search, Filtering

Real-Time: Socket.IO, WebSockets, Events, Rooms, Broadcasting, Real-Time Messaging, Presence, Typing Indicators

Performance: Redis, Caching, Cache Expiration, Rate Limiting

Tools: Git, GitHub, Docker, Docker Compose, Linux, Postman, npm, Nodemon, Environment Variables

Other: React (learning), Vite, Tailwind CSS, Cloudinary, Multer

PROJECT EXPERIENCE

ChatFlow API — Real-Time Chat Backend

Node.js, Express.js, MongoDB, Mongoose, Socket.IO, JWT, Redis, Docker

- Built a real-time chat backend combining REST APIs with event-driven Socket.IO communication.
- Implemented 4 core real-time capabilities: messaging, rooms, online presence, and typing indicators, with authenticated communication.
- Designed MongoDB/Mongoose data models and API workflows for persistent users and chat data.
- Applied Redis caching concepts and Docker-based local infrastructure for performance-oriented and reproducible development.

DevBlog API — Blogging and Content Management Backend

Node.js, Express.js, MongoDB, Mongoose, JWT, bcrypt, Redis, Cloudinary, Multer

- Developed a blogging REST API covering 10+ feature areas including authentication, post CRUD, publishing, comments, likes, bookmarks, categories, tags, search, filtering, pagination, and sorting.
- Implemented JWT access and refresh tokens, protected routes, authorization checks, and bcrypt password hashing and verification.
- Added unique slug generation, MongoDB relationships, Mongoose population, and view-count updates.
- Integrated Multer and Cloudinary for image uploads and Redis for rate limiting, caching, and cache expiration.

HamroPasal — Online Food Ordering System

Web application project involving product data, ordering workflows, database operations, and frontend/backend integration.

Meme Generator Studio

Interactive web application using external API integration, dynamic rendering, and user-driven content generation.

LEADERSHIP EXPERIENCE

CodeFest 2025 — Event Organizer

- Organized and coordinated CodeFest 2025 with team members and participants, contributing to technical event planning and execution.
- Developed leadership, communication, teamwork, coordination, and event-management skills through a technical community program.

EDUCATION

Bachelor of Computer Applications (BCA) — 7th Semester | Nepal

ADDITIONAL BACKEND EXPERIENCE

API Development: Built Express.js routes and middleware, handled request/response lifecycles, protected endpoints, validation, HTTP status codes, and centralized error handling.

Authentication & Security: Implemented JWT access and refresh token flows, bcrypt password hashing, authorization middleware, cookies, protected endpoints, and environment-based secrets.

Database Development: Worked with MongoDB and Mongoose schemas, references, population, CRUD operations, search, filtering, pagination, sorting, and database-driven workflows.

Real-Time Systems: Worked with Socket.IO events, persistent connections, rooms, broadcasting, connected users, real-time messaging, typing indicators, and online presence.

Performance: Implemented and explored Redis caching, cache expiration, and rate limiting to reduce repeated database work and control request volume.

CURRENT TECHNICAL DEVELOPMENT

- Advanced JavaScript: execution context, lexical scope, closures, prototypes, prototype chain, this, event loop, promises, async/await, microtasks, and macrotasks.
- TypeScript: types, interfaces, generics, type narrowing, and type-safe Node.js development.
- React: components, props, state, hooks, Vite, and frontend-to-backend API integration.
- Backend architecture: controller-service-model patterns, API security, database optimization, Redis, Docker, and real-time system design.

DEVELOPMENT PRACTICES

Git version control | GitHub | Feature branching | Environment variables | Modular backend structure | Controller-Service-Model architecture | API testing with Postman | Linux development | Docker-based development | Debugging

CAREER OBJECTIVE

Seeking a backend developer, Node.js developer, or software engineering internship where I can contribute to API development, authentication, databases, real-time systems, and backend architecture while learning production engineering practices.
